

# Are you an Excel user at work?

Do you or would you like to audit your transactions and produce your reports in Microsoft Excel? If so read on;

## Have you ever wanted the ability to?

Permanently override your corporate database names to sensible column headings for Excel.

Summarise corporate data before importing to Excel.

Perform data selections with validation

Schedule and run your Excel spreadsheets including Macros and reporting without being present.

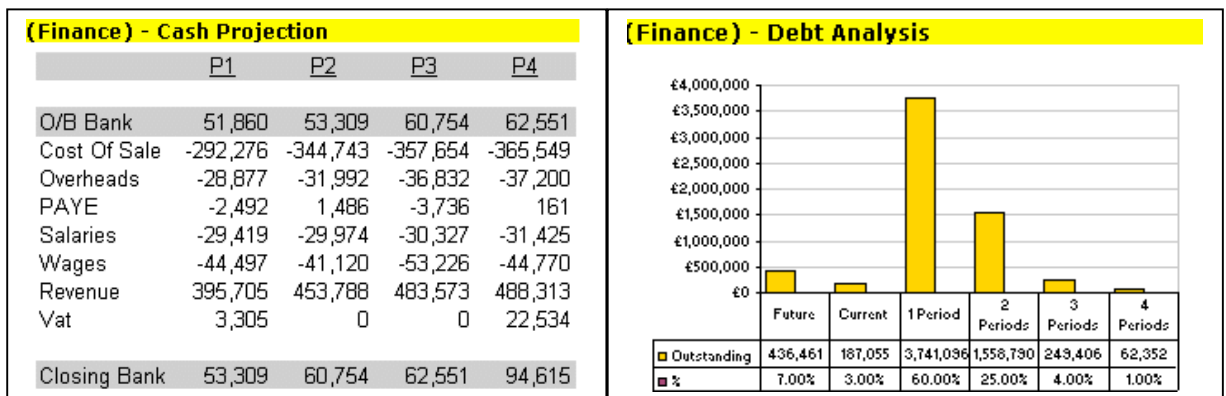

Let us do the mundane and repetitive to allow you to use your skills in the audit and validation area!

## Delivering Management Reporting faster

**Data extraction**  
**Information formatting**  
**Audit**  
**Publishing**

eXant eXporter  
eXant eXporter  
You  
eXant Business Monitor or  
Microsoft Excel

eXant - eXporter

## Key Benefits

**Variables** - Data Selection every time

**Creation Options** - No more copying or renaming before you start

**Auto Renaming** - Automatic archiving

**Select & Compare** - Audit and Validation capabilities

**Browser Based** - Can be run from any location dependant upon network infrastructure

## Key Features

**Fast** – With just three clicks you can get the data you require into Excel.

**Simplification** - Users see only the Tables and Columns they need to see. All technical naming and other jargon are removed. Familiar intuitive point & click techniques are used.

**Microsoft focus** - Data can be exported to a variety of formats and Microsoft Office products (Excel, Access, HTML, XML SQL Server Database and Text).

**Security** - The eXPorter dictionary view of the database provides you with a secure environment for operation. Columns can be omitted and data filtered by user. Tables can be joined for end user ease of use.

**Dictionaries** - eXPorter can operate with multiple authorised dictionary views of the database.

**Easy to use** - Dictionaries are created by simple-to-use wizards.

**Browser based** – All programs, dictionaries and user processes reside on a single server with user access via browser ensuring minimum installation and maintenance effort.

**Sharing** – Any Export Process can be shared with other authorised users across your organisation

**Views** - Multiple tables can be selected, joined, and catalogued as a single views for re-use.

**Record selection** - Row selection criteria can be specified within the extraction process.

**Preview Data** - The selection criteria may be reviewed by means of a preview pane at any time when defining the extraction process.

**Variables** - Variable run-time prompts may be created on selected columns (E.g. range of periods etc...).

**Calculation** – New (computed) fields in the selected rows may be created by the use of simple maths.

**Sorting** - The data may be sorted in to any sequence based on column values.

**Grouping** – 'Aggregate' and 'Group By' functions are available to summarise data at designated levels. Minimum, Maximum, Average, Count, Sum, etc functions are available.

**Control** – Data can be exported to an existing Excel worksheet containing previously created tables and charts. A specific range of cells may be designated to protect any Excel formatting.

**Linked Processes** - Extracts can be linked to other Microsoft processes as a series of auto run steps. Within a Linked Process the logic flow may be dynamically determined by examination of return-codes created at the termination of EVERY step.

**E-mail** – Ability to send spreadsheets by e-mail to a list of users.

**SMS** – Ability to send summary data by SMS

**Scheduling** – All processes and outputs can be scheduled.
